                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq length: 0 seq length: 2000000000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes the full-length cell surface receptor ACT-4 isolated from activated CD4+ T-lymphocytes. The sequence may be expressed in e.g. COS-7 cells. The encoded protein, its ligands or fragments, and antibodies may be used for the treatment of transplant rejection, graft-versus-host disease, autoimmune disease, etc.

                                                                                                                                                                                                                                                                                    ACT-4-L-h-l is a specific binding partner (sbp) to the ACT-4 receptor polypeptide (encoded by this sequence) on the surface of activated CD4 positive B cells. The sbp and its fragments are useful in pharmaceutical compositions to modify a patient's immune response as well as having application in the treatment of transplant rejection, graft versus host disease, autoimmune disease, inflammation, infectious agents, HTLV infected cells or HTV. specifically the sbd can be used to treat inflammatory bowel disease. The sbd can also be used for screening for immunomodulatory agents able to recognise ACT-4 and for monitoring activated CD4 positive cells or inhibiting infection of CD4 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cleavage-site

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of the human tumour necrosis factor receptors TRI3 and TRI4. These sequences are useful in the diagnosis and treatment of many diseases, including cancer, autoimmune diseases, cardiovascular disorders, allergies, neurodegenerative diseases, graft rejection, inflammation, aneurysms and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding 2 human tumor necrosis factor receptor polypeptides ((TRI3) and (TRI4)), useful for the prevention, diagnosis and treatment of, e.g. cancers, acquired immune deficiency syndrome and hypohidrotic ectodermal dysplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;

RESULT
                                cc activities, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins and complementary polynucleotides. TRID proteins and complementary polynucleotides. TRID proteins and complement of tumours, resistance to polynucleotides are useful in the treatment of tumours, resistance to comparative bacteria and viruses, restenosis and graft versus host disease. They are also useful for inducing proliferation of T-cells, endothelial colls and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after stimulation of TRID by can agonist or TRAIL binding facilitator. The antibodies which bind TRID casceive associated with increased or decreased apoptotic cell death. The TRID collynucleotides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) autoimmune disorders; (c) diseases associated with increased concers apoptosis; (d) cardiovascular disorders; and (e) viral infection. The present sequence represents a tumour necrosis factor receptor used in comparison with TRID in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                    The present invention describes the human TRID protein (tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor receptor 5 (TNFR-5 or TR5)). TRID has cytostatic, immunosuppressive, nootropic, neuroprotective, antiviral, antiinflammatory, anticonvulsant, antiparasitic, cardiant, anti-HIV, antiparkinsonian and vasotropic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunosuppressive; neuroprotective; antiviral; antiinflammatory; anticonvulsant; antiparasittc; cardiant; anti-HTV; antiparkinsonian; gene therapy; restenosis; graft versus host disease; tumour; cancer; apoptotic cell death related disease; autoimmune disorder; cardiovascular disorder; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid encoding a TRID polypeptide, also referred to as necrosis factor receptor 5, useful in the diagnosis, treatment prevention of cancer, autoimmune disorders and viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Fig 2; 285pp; English.

RESULT
AAR76996
the OX-40 antigen was identified (expressed on the surface of activated autoantigen specific CD4+ T-cells present at the site of inflammation but absent on CD4+ T-cells at non-inflammatory sites) and cDNA encoding the antigen was isolated. PCR primers were designed and used to clone murine OX-40 CDNA by PCR from RNA isolated from murine CD4+ T-cells activated with concanavalin A. Then the murine OX-40 CDNA was used to probe a cDNA lambda gtll library from human activated T lymphocytes to obtain human OX-40 CDNA. The published patent application states that the OX-40 CDNA sequence is also in SQ ID no. 1, but this sequence is not present in the spec. A nucleic acid having the sequence in SQ ID no 1 and
                                                                                                                                                                                                                                                                                 Antigen OX-40 is specifically expressed on the cell surface of antigen activated T-cells. A specially, for example, CD4+ T-cells. A human cDNA encoding the human OX-40 homologue was cloned as follows. Using the Experimental Autoimmune Encephalomyelitis model in rats

                                                                         The present invention describes peptides and peptide analogues which correspond in primary sequence to a binding loop of a tumour necrosis factor receptor (TNF-R) superfamily member. The compounds are especially designed from a binding loop of TNF-R p55. They are capable of inhibiting TNF binding to its cellular receptors and may be used to inhibit the biological activities of TNF-They may be used in treating TNF-associated conditions such as scute and chronic inflammatory responses, septic shock, cachexia, autoimmunity, graft-versus-host disease, skin allergic reactions, immune complex disease, g. oral, transplantation rejection and malaria. Administration is, e.g. oral,

                                   and immunocoulatory activities, and are tumour necrosis factor (TNF)-related activation-induced cytokine (TRANES)/ receptor activator of NF-kappaB ligand (RANK) inhibitors. The method is useful for treating diseases characterised by bone loss such as osteoporosis, Paget's disease, metastatic bone disease, rheumatoid arthritis or periodontal disease, and modulating dendritic cell maturation. T cell proliferation, and/or CD40 receptor systems. The present sequence represents an extracellular Cys-rich domain of a tumour necrosis factor receptor (TNF-R) superfamily member, which is used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                      The present sequence represents a secondary signalling sequence, which is linked to a non-natural stimulatory primary signalling motif to produce a cytoplasmic signalling motif. The primary motif is efficient at mediating immune cell signal transduction, particularly when incorporated in an intracellular signalling domain of a chimeric receptor. The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating inmunocleficions within infectious diseases e.g. human immunocleficions within the main form infectious diseases e.g. human

                                                                                                                      The invention relates to a novel nucleic acid encoding an adaptor CC receptor protein comprising an extracellular ligand-binding domain, a CC transmembrane domain and an intracellular signalling domain. The CC intracellular signalling domain comprises the cytoplasmic portion of at CC least one adaptor protein, and the extracellular ligand-binding domain CC is not CDB or a major histocompatibility complex (MHC) class I protein. CC The adaptor receptor protein and the nucleic acid encoding it are useful in therapy. They are useful in the manufacture of a medicament for the CC treatment or prevention of disease in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection). CC congenital diseases (e.g. cystic fibrosis and sickle cell anaemia). CC dermatological diseases (e.g. cystic fibrosis and sickle cell anaemia). CC dermatological diseases (e.g. cystic fibrosis and sickle cell anaemia). CC multiple sclerosis), organ transplant rejection, graft-versus-host cell disease and metabolic/idiopathic diseases such as diabetes and cancer. CC invention. Secondary signalling motif used in the CC invention. Secondary signalling motif used in the CC invention. Secondary signalling motif used as used as components of the adaptor receptor protein of the invention. Motifs were isolated from CD28, CD134 and CD154.

                                                               transduction, particularly when incorporated in an intracellular signalling domain of a chimeric receptor. The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating human patients suffering from infectious diseases e.g. human immunodeficiency virus (HIV) infections, inflammatory/autoimmune diseases such as asthma and eczema, congenital diseases e.g. cystic fibrosis, sickle cell anemata, dermatological diseases e.g. soriasis, neurological diseases e.g. multiple sclerosis, transplant-related disease e.g. organ transplant rejection, graft versus host disease, metabolic/idiopathic disease e.g. diabetes, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stimulatory primary signalling motif; immune cell; signal transduction; chimeric receptor; inflammatory disease; autoimmune disease; asthma; eczema; congenital disease; cystic fibrosis; sickle cell anemia; dermatological disease; psoriasis; neurological disease; multiple sclerosis; transplant-related disease; metabolic disease; organ transplant rejection; graft versus host disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a secondary signalling sequence, which may be linked to a non-natural stimulatory primary signalling motif The primary motif is efficient at mediating immune cell signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel cytoplasmic signalling protein and chimeric receptor protein, useful for treating HIV infection, asthma, eczema, psoriasis, multiple sclerosis, contain non-natural stimulatory primary signalling motif -

                                                                                                                                                          CC The invention relates to novel primary signalling motifs containing CC a consensus amino acid sequence. These motifs are extremely CC efficient at mediating immune cell signal transduction, particularly CC when incorporated into an intracellular signalling domain of a chimeric CC receptor. Nucleic acids that encode, and polypeptides that contain, CC these primary signalling motifs are useful in medicine and research. CC They are useful in therapy, or in the manufacture of a medicament for CC treating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), CC inflammatory or autoimmune diseases (e.g. asthma or eczema), congenital CC diseases (e.g. cystic fibrosis or sickle cell anaemia), dermatological CC diseases (e.g. psoriasis), neurological diseases (e.g. multiple CC sclerosis), organ transplant rejection or graft-versus host disease, or CC present sequence is one of a large number of primary and secondary CC signalling motifs used in the invention. Primary signalling motifs are Sequences that transduce either a stimulatory or an inhibitory signal, CC which regulates primary activation of the T cell receptor (TCR) complex. Secondary motifs impart secondary or co-stimulatory signalling capacity CC to a molecule in T cells. GS linkers have been incorporated at each CC end of the present sequence to facilitate cloning.

                                                                                    The invention relates to a novel nucleic acid encoding an adaptor creceptor protein comprising an extracellular ligand-binding domain, a C transmembrane domain and an intracellular signalling domain. The cintracellular signalling domain comprises the cytoplasmic portion of at least one adaptor protein, and the extracellular ligand-binding domain. The cintracellular signalling domain comprises the cytoplasmic portion of at least one adaptor protein, and the extracellular ligand-binding domain. The cintracellular ligand-binding domain comparises the cytoplasmic portion of at least one adaptor receptor protein and the nucleic acid encoding it are useful complex (MHC) class I protein. The treatment of infections diseases (e.g. HIV infection), complex compenity of infections diseases (e.g. HIV infection), complex congenital diseases (e.g. cystic fibrosis and sickle cell anaemia), compenital diseases (e.g. cystic fibrosis and sickle cell anaemia), compenital diseases (e.g. psoriasis), neurological diseases (e.g.) compenital diseases (e.g.) compenity and secondary signalling motifs (compenity and secondary signalling motifs (compenity activation of the T cell receptor (TCR) complex. Secondary compenits and compenity be compenity of the adaptor receptor protein of the used as components of the adaptor receptor protein of the view of the contains a GS linker at the N-terminus to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antisickling; antipsoriatic; neuroprotective; immunosuppre

                  when incorporated into an intracellular signalling domain of a chimeric creeptor. Nucleic acids that encode, and polypeptides that contain, these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for treating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), inflammatory or autoimmune diseases (e.g. asthma or eczema), congenital diseases (e.g. cystic fibrosis or sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g. multiple sclerosis), organ transplant rejection or graft-versus-host disease, or metabolic/idiopathic diseases (e.g. diabetes or cancer). The present sequence is a secondary signalling sequence used in the co-stimulatory signalling capacity to a molecule in T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Loc

                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for treating conditions leading to bone loss. The method comprises administering a purified and isolated osteoprotegerin (OPG) protein (AMF57836-AMF57838 and AMB66974-AMB66976) in conjunction with other substances such as tumour necrosis factor-alpha (TNF-alpha) inhibitors, interleukin (IL)-6, -8 and -18 inhibitors, ICE modulators, fibroblast growth factor (FGF)1-10 modulators and/or platelet activating factor (PAF) antagonists. The method is useful for treating conditions leading to bone loss such as rheumatoid arthritis, multiple sclerosis, osteoprosis, osteomyelitis and asthma. The method is also useful for treating inflammation, systemic lupus erythematosus (SLE) and graft-versus-host disease (GVHD). Other diseases that can be treated include acute pancreatitis, Alzhelmer's disease, anorexia, atherescales are constant conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0x40

The cDNA (AAV32640) encoding OX40 extracellular domain was used in the construction of the chimeric OX40/Fc cDNA (AAV32640). The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the OX40 murine T cell antigen. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed

The Fc fragment may be derived from human IgG1, and the plasmid may be used to transform the CV-1/EBNA (ATCC CRL 10478) monkey kidney cell line. Culture supernatant was purified by affinity chromatography and this was used, together with labeled goat anti-human IgG to

The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.
                                                                  binding protein (OBM-BP) of preventive and/or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         OBM-BP; OBM binding protein; osteoclast formation bone metabolic disease; osteoporosis; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                    The present sequence represents murine osteoclast differentiation CC and activation receptor (ODAR). The present invention describes CC osteoprotegerin (OPG) binding protein. Host cells transfected with CC vectors containing nucleic acid molecules encoding OPG binding protein CC are used to produce recombinant OPG binding protein. OPG binding protein is used in binding assays to determine osteoprotegrin (OG) in biological CC samples; to screen for specific binding agents (particularly agonists and antagonists, including intracellular proteins); to raise Ab (useful CC in immunoassays for detection of OPG binding protein to ODAR. The CC compounds that modulate binding of OPG binding protein to ODAR. The CC opg binding protein encoding Sequences, e.g. screening for related CC OPG binding protein encoding sequences, e.g. screening for related CC opg binding protein models, while complementary capuances are used for antisense regulation of OPG binding protein complementary complementary soluble forms of OPG binding protein, particularly soluble CC diseases, e.g. osteoporosis, bone loss caused by arthritis or of operation of the protein of operation of the particularly soluble contents of OPG binding protein, particularly soluble of operations, paget's disease, periodontal disease, with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       30-MAR-1998;

                                                                     CC factor-kappab (NF-kB)) polypetide which is a homolog of the human RANK. CC RANK is a member of the tumour necrosis factor (TNF) family. A soluble can may be used for inhibiting activation of NF-kB, by contacting a cell cexpressing membrane-associated RANK with a soluble RANK which binds to CC RANK ligand (RANKL). RANKL polypeptides can activate RANK and can be cused to induce maturation of dendritic cells and enhance their collusted rank polypeptide composition may also be used for regulating an collumnume or inflammatory response. Inhibition of NF-kB by RANK antagonists compose that result from triggering of RANK, e.g. in treating toxic concepts that result from triggering of RANK, e.g. in treating toxic concepts of sused to identify inhibitors of RANK. RANKL polypeptides can also be used in adjunct therapy for disease concepts used to identify inhibitors of RANK. RANKL polypeptides can inflammatory response, and also for protecting RANK. RANKL polypeptides con inflammatory response, and also for protecting RANK. RANKL polypeptides con inflammatory response, and also be used in diplunct therapy for disease con also be used to identify inhibitors of RANK. RANKL polypeptides con inflammatory response, and also for protecting RANK. RANKL polypeptides con inflammatory response, and also for protecting RANK. Rayresing cells con firalpha. The products can also be used for detection and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                  This represents the murine muRANK (receptor activator of necrosis factor kappaB (NF-kB)) polypetide which is a homolog of the human RANK. Is a member of the tumour necrosis factor (TNF) family. Host cells transformed or transfected with an expression vector comprising the RANK encoding nucleic acid can be used to produce recombinant RANK protein. The soluble RANK may be used for inhibiting activation of NF-kB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to RANK ligand (RANK). The soluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-kB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graftversus-host reactions, or acute inflammatory reactions. They can also be used in adjunct therapy for disease characterised by nepplastic cells
                                                                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RANK; necrosis factor-kappa B; NF-kB; receptor activator; human; immune response; inflammatory response; toxic shock; sepsis; RANKL; RANK ligand; tumour necrosis factor; TNF; murine.

The protein is useful as a preventive and/or treating agent for bone metabolic diseases such as osteoporosis. Substances which inhibit the binding of OBM to OBM-BP can be used as biochemical reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       OBM-BP; OBM binding protein; osteoclast formation bone metabolic disease; osteoporosis; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         regulating osteoclast generation and inhibiting osteoclast generation in individuals inflicted with excess bone resorption. Especially, the RANK protein is used to treat individuals at risk for excess bone loss, osteoporosis, Paget's disease, bone cancer and cancers associated with hypercalcenia. The RANK protein ameliorates the effects of excess bone loss, by binding to its ligand and inhibiting binding of other cells expressing RANK. It thus decreases osteoclastogenesis when administered into metastasising cancer, such as breast cancer, multiple myeloma, melanomas, lung cancer, prostrate, hematologic, head and neck, and renal which metastasise to bone and induce bone breakdown by locally disrupting normal bone remodelling, by disrupting the osteoclast differentiation pathway. This results in the reduction in the number of osteoclasts, lesser bone resorption and relief from the negative effects of hypercalcenia. The RANK protein also ameliorates systemic effects by interfering with I/II signal transduction that leads to the differentiation of osteoclast precursors into osteoclasts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

The patent discloses novel receptor activator of nuclear factor (NF)-

CR kappab (RANK) proteins and their corresponding DNAs. RANK is a member

CR of the tumour necrosis factor (TNF) receptor superfamily and associates

CR with TNF receptor associated factor (TRAF) 2 and 3 which are important

CR in the regulation of immune and inflammatory response. The receptors

CR are useful for regulating immune response and in screening for inhibitors

CR of these receptors. The cytoplasmic domain of RANK is used in developing

CR assays for inhibit interaction of RANK is used in developing

CR assays for inhibit interaction of RANK is used in developing

CR are useful in ameliorating the negative effects of an inflammatory

CR response that result from triggering of RANK, e.g. in treating toxic

CR shock or sepsis, graft versus host reactions, acute inflammatory

CR reactions and the effects of bone resorption. RANK acts as an anti-

CR apoptotic signal and rescue the cells that express RANK from apoptosis.

CR antagonists of RANK-mediated NF-kappa B activation, or to inhibit

CR antagonists of RANK-mediated NF-kappa B activation, or to inhibit

CR are useful for modulating the formation of osteoclastic cells that

CR express RANK. Compounds that interfere with RANK/TRAF6 interactions

CR are useful for modulating the formation of osteoclasts from osteoclast

CR are useful for modulating steeclast function and activities. They

CR are useful in preparing kits for the detection of soluble RANK, or

CR monitor RANK-related activity. The present sequence is RANK proteins

CR of the presence or distribution of RANK transcripts, while the proteins

CR of the presence or distribution of RANK transcripts.

CR of the presence or distribution of RANK transcripts, while the proteins

CR of the presence or distribution of RANK transcripts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to receptor activator of NF-chi B (RANK) DNA. RANK is mapped to chromosome 18q22.1 and its ligand (RANKL) to chromosome 13q14. RANK and RANKL are type 1 and type 2 transmembrane. proteins respectively. RANK is a member of the tumour necrosis factor (TNF) superfamily and it closely resembles CD40 in the extracellular region. RANK associates with TNF receptor-associated factor (TRAF) 2 and TRAF3. The DNA molecules are useful for producing ligands of RANK. The ligands are useful for regulating immune response and in screening

The present invention relates to a novel receptor, referred to as RANK CC (receptor activator of NF (nuclear factor)-kappaB), a member of TNF CC (tumour necrosis factor) receptor superfamily. RANK is a Type I CC transmembrane protein that interacts with TNF receptor-associated factors (TRAFS). Triggering of RANK by overexpression or co-expression of factors (TRAFS). Triggering of RANK by overexpression or co-expression of factor NF-kappaB, a winguitous transcription factor of the transcription factor NF-kappaB, a winguitous transcription factor that is most extensively utilised in cells of the immune system. CC inhibition of Nf-kappaB by RANK antagonists is useful in ameliorating negative effects of inflammatory reactions, and the effects of excess comparation of pharmaceutical compositions, for infecting target for the preparation of pharmaceutical compositions, for infecting target cells for use in gene therapy applications in diagnosing diseases compared with RANK, and as targets for use in screening assays. They may be used in the treatment or diagnosis of immune system dysfunction. The present invention also encompasses gene therapy methods to correct consecutivating mutations, associated with e.g. familial expansile of correct maino acid sequence is murine RANK (muRANK) protein. This sequence which is a type I transmembrane protein contains a predicted 30 amino acid signal sequence, a 184 amino acid extracellular domain, a 21 amino acid signal sequence, a 184 amino acid extracellular domain, a 21 cmino acid mino acid companies domain and a 390 amino acid cytoplasmic tail.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Key

                                                                                                                                                                                                                              The present sequence is a functional mouse acrosome reaction protein, PKDREJ or P3. PKDREJ is a sperm protein involved in binding the sperm to the egg and/or triggering the acrosome reaction. It exhibits homology to human polycystin-1 and surEJ. It can be used to identify antibodies or proteins that block the acrosome reaction and compounds that trigger acrosome reaction in the absence of zona protein can be used to increase fertility and those blocking its action can be used as contraceptives. DNA encoding PKDREJ can be used gene therapy and also as primer or probe for identifying sequences that encode mutant forms of acrosome reaction protein.

polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics formatics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not appear in the specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polynucleotide (I) and

                                                                                                                                   Ş
                                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotide (I) and CD polypeptide (II) sequences. (I) is useful as hybridisation probes. CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques (CI). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical consisting of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and CC and to produce other types of data and products dependent on DNA and CC amino acid sequences of the invention.

CC specification, but was obtained in electronic format directly from WIPO or internation in the mino acid sequences of the invention.
                                                                                                                                                                        Query Match
